Figure 1: vim setup

1 Introduction

Start by installing vim (neovim), R tex vimtex ultisnips

See post "Setting up a minimal neovim..." for details on installing plugins with Neovim.

```

5 Practical application

- 1) set analysis goal: Logistic regression of Palmer Penguins data set predicting gender.
- 2) mkdir \sim /sbx/penguins
- 3) mvim peng.Rmd
- 4) type rheader on the first line and hit TAB. The will match the snippet string in Ultisnips and insert a text template with YAML markup and latex text (for bibtex use). The snippet has X tabstops to allow customization of the text block. Enter text in the first block indicating the project name and then hit C-j to navigate to the next tab stop: the title. Repeat the process to provide the project specific information in the YAML and bibliography call. NB: don't leave insert mode when navigating between tabstops or the ultisnip process with exit.

6 Rmd template

6.1 YAML header

The RMD file contains a YAML metadata header delineated with the lines "—" above and below. For this example we want to generate a pdf formatted output file.

The YAML can be as simple as one line specifying the output as pdf.

```
---
output: pdf_document
```

Which results in a simple output file as follows:

Introduction
Begin by looding the palmerpenquins package.

NB. to invoke file completion in vim for the rmd (or quarto) change the vim filetype using the command:

```
:set filetype=tex
```

then enter, e.g., \includegraphics{ or \input{ followed by C-x C-o. and a pop-up menu with possible completions with appear.

```
title: "Penguins data analysis"
author: "R.G. Thomas"
date: "2023-12-26"
output:
  pdf_document:
    keep_tex: true
    includes:
header-includes:
    - \usepackage{lipsum, fancyhdr, titling, currfile}
    - \usepackage[export]{adjustbox}
    - \pagestyle{fancy}
    - \pretitle{
    - \begin{flushright} \includegraphics[width=3cm, valign=c]{sudoku.pdf}
    - \end{flushright}
    - \noindent\rule{\linewidth}{2pt}\begin{flushleft}\LARGE}
    - \posttitle{\end{flushleft}\noindent\rule{\linewidth}{2pt}}
::: column-margin
![simple pdf](penguins/peng_mid.pdf)
:::
# Introduction
Begin by loading the palmerpenguins package.
::: {.cell}
```{.r .cell-code}
df1 <- palmerpenguins::penguins
```
