Setting up Quarto

Ronald (Ryy) Glenn Thomas

1 Introduction

Quarto is an extension of the Rmarkdown ecosystem. It leverages the power of `Pandoc`. From my perspective it provides a number of useful additional tools for literate programming and blogging.

I'm using quarto for my lab's home page with an embedded blog. rgtlab blog.

Useful archive:

mcanouil/awesome-quarto: A curated list of Quarto talks, tools, examples & articles! Contributions welcome!

Consider some ideas from

- Rob Hyndman - Template of quarto website

- Eric Ekholm - [Modifying the Default Quarto Blog Structure](#)

- Allison Hill - [We don't talk about Quarto](#)

- Nick Tierney - [Notes on Changing from Rmarkdown/Bookdown to Quarto](#)

This post will include some of the most useful and interesting quarto tools presented in the context of a `Palmer Penguins` data set analysis.

2 - Code

This is `inline` code plus a small code chunk.

```r
library(tidyverse)

ggplot(mpg) +
  geom_jitter(aes(cty, hwy), size = 4, alpha = 0.5)
```

2.0.1 - Tabsets

2.0.1.1 Transforming OLS estimates

```
preds_lm %>%
  ggplot(aes(body_mass_g, bill_length_mm, col = correct)) +
  geom_jitter(size = 4, alpha = 0.6) +
  facet_wrap(vars(species)) +
  scale_color_manual(values = c('grey60', thematic::okabe_ito(3)[3])) +
  scale_x_continuous(breaks = seq(3000, 6000, 1000)) +
  theme_minimal(base_size = 12) +
  theme(
    legend.position = 'top',
    panel.background = element_rect(color = 'black'),
    panel.grid.minor = element_blank()
  ) +
  labs(
    x = 'Body mass (in g)',
    y = 'Bill length (in mm)'
  )
```

2.0.1.2 Maximizing likelihood

```
glm.mod <- glm(sex ~ body_mass_g + bill_length_mm + species, family = binomial, data = dat)

preds <- dat %>%
  mutate(
    prob.fit = glm.mod$fitted.values,
```
```
    prediction = if_else(prob.fit > 0.5, 'male', 'female'),
    correct = if_else(sex == prediction, 'correct', 'incorrect')
  )

preds %>%
  ggplot(aes(body_mass_g, bill_length_mm, col = correct)) +
  geom_jitter(size = 4, alpha = 0.6) +
  facet_wrap(vars(species)) +
  scale_x_continuous(breaks = seq(3000, 6000, 1000)) +
  scale_color_manual(values = c('grey60', thematic::okabe_ito(3)[3])) +
  theme_minimal(base_size = 10) +
  theme(
    legend.position = 'top',
    panel.background = element_rect(color = 'black'),
    panel.grid.minor = element_blank()
  ) +
  labs(
    x = 'Body mass (in g)',
    y = 'Bill length (in mm)'
  )
```

2.0.1.3 - Some math stuff

$$\int_0^1 f(x) \ dx$$

2.1 2 - Columns

```r
geom_density(                    stat_density(
  mapping = NULL,                  mapping = NULL,
  data = NULL,                     data = NULL,
  stat = "density",                geom = "area",
  position = "identity",           position = "stack",
  ...,                             ...,
  na.rm = FALSE,                   bw = "nrd0",
  orientation = NA,                adjust = 1,
  show.legend = NA,                kernel = "gaussian",
  inherit.aes = TRUE,              n = 512,
  outline.type = "upper"          trim = FALSE,
)                                  na.rm = FALSE,
                                   orientation = NA,
                                   show.legend = NA,
                                   inherit.aes = TRUE
                                 )
```

2.2 2 - Margin captions

```r
ggplot(data = gapminder::gapminder, mapping = aes(x = lifeExp, fill = continent)) +
  stat_density(position = "identity", alpha = 0.5)
```
Figure 1: Bla bla bla. This is a caption in the margin. Super cool isn't it?

Start with running quarto create-project at `~/prj` level

```
quarto create-project qblog --type website:blog

Creating project at /Users/zenn/Dropbox/prj/qblog:
  - Created _quarto.yml
  - Created index.qmd
  - Created posts/welcome/index.qmd
  - Created posts/post-with-code/index.qmd
  - Created about.qmd
  - Created styles.css
  - Created posts/_metadata.yml
```

- cd to ~/qblog/posts/
- create a new directory, say setupquarto
- cd to ~/qblog/posts/setupquarto
- vim index.qmd

""
